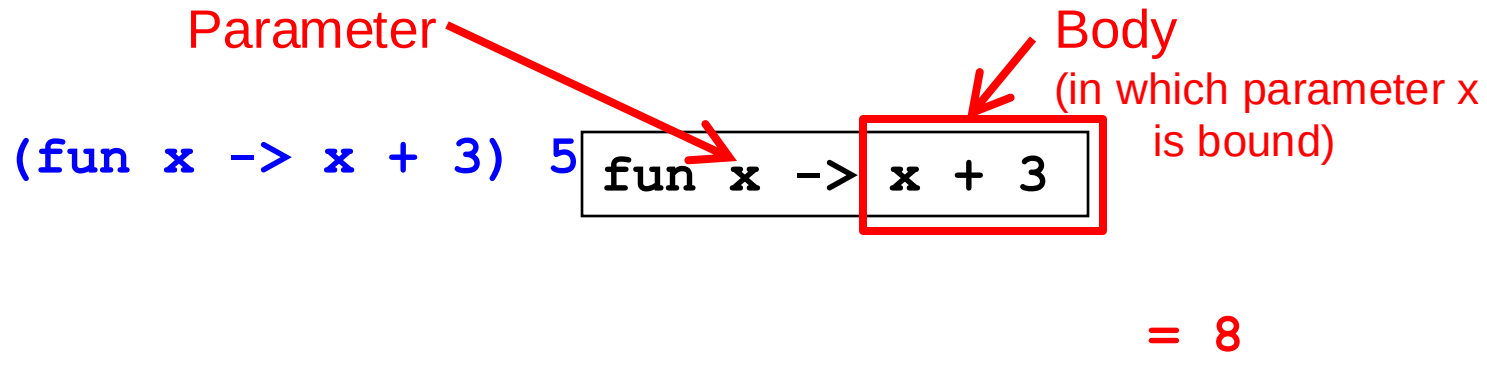
Higher Order Functions

Anonymous Functions

- Use fun to make a function with no name



Anonymous Functions

- Syntax
  - **fun** ***x1*** … ***xn*** **->** ***e***
- Evaluation
  - An anonymous function is an expression
  - In fact, *it is a value*.
- Type checking
  - (**fun** ***x1*** … ***xn*** **->** ***e***) : (***t1*** **->** … **->** ***tn*** **->** ***u***)

    when ***e*** : ***u*** under assumptions ***x1*** : ***t1***, …, ***xn*** : ***tn***.
    - (Same rule as **let** ***f*** ***x1*** … ***xn*** **=** ***e***)

or

```
let twice f x = f(f x);;
(* ('a -> 'a) -> 'a -> 'a *)

twice (fun x -> x+1) 10;;
(* returns 12 *)
```

Quiz 1: What does this evaluate to?

```
let y = (fun x -> x+1) 2 in
(fun z -> z-1) y
```

3 in

A. *Error*

B. 2

C. 1

D. 0

let y = 3 in (fun z -> z-1) y

fun z -> 3 - 1

= 2

Quiz 1: What does this evaluate to?

```
let y = (fun x -> x+1) 2 in
(fun z -> z-1) y
```

A. Error

B. 2

C. 1

D. 0

Quiz 2: What is this expression's type ?

```
(fun x y -> x) 2 3
```

A. *Type error*

B. `int`

C. `int -> int -> int`

D. `'a -> 'b -> 'a`

Quiz 2: What is this expression's type ?

```
(fun x y -> x) 2 3
```

A. *Type error*

B. `int`

C. `int -> int -> int`

D. `'a -> 'b -> 'a`

Functions and Binding

- Functions are first-class, so you can bind them to other names as you like

```
let f x = x + 3;;
let g = f;; ⇒ 8
g 5
```

Example Shorthands

- let for functions is a syntactic shorthand

  `let f x = body` is semantically equivalent to

  `let f = fun x -> body`

- `let next x = x + 1`
  - Short for `let next = fun x -> x + 1`

- `let plus x y = x + y`
  - Short for `let plus = fun x y -> x + y`

Quiz 3: What does this evaluate to?

```
let f = fun x -> 0 in
let g = f in
let h = fun y -> g (y+1) in
h 1
```

A. `0`

B. `1`

C. `2`

D. Error

Quiz 3: What does this evaluate to?

```
let f = fun x -> 0 in
let g = f in
let h = fun y -> g (y+1)
h 1
```

A. 0

B. 1

C. 2

D. Error

Nested Functions

```
(* Filter the odd numbers from a list *)
let filter lst =
  let rec aux l =
      match l with
      |[] -> []
      |h::t-> if h mod 2 <> 0 then h::aux t
        else aux t
     in
  aux lst

filter [1;2;3;4;5;6] (* int list = [1; 3; 5] *)
```

Passing Functions as Arguments

You can pass functions as arguments

```
let plus3 x = x + 3 (* int -> int *)

let twice f z = f (f z)
(* ('a->'a) -> 'a -> 'a *)
```

```
twice plus3 5 = 11
```
